Digital Image Processing

Image Enhancement: Filtering in the Frequency Domain

Contents

In this lecture we will look at image enhancement in the frequency domain

- Jean Baptiste Joseph Fourier
- The Fourier series & the Fourier transform
- Image Processing in the frequency domain
 - Image smoothing
 - Image sharpening
- Fast Fourier Transform

Jean Baptiste Joseph Fourier

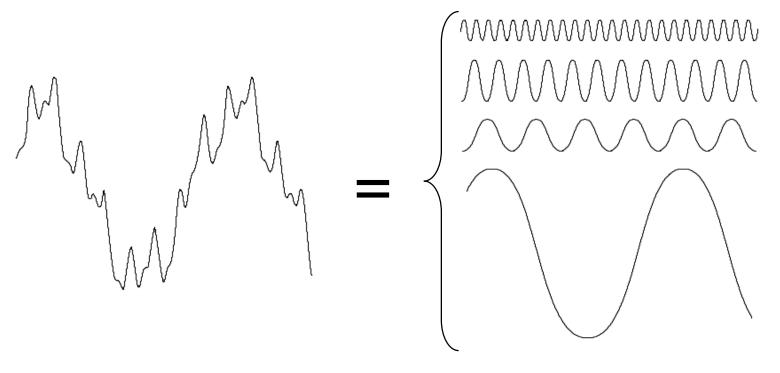

Fourier was born in Auxerre, France in 1768

- Most famous for his work "La Théorie Analitique de la Chaleur" published in 1822
- Translated into English in 1878: "The Analytic Theory of Heat"

Nobody paid much attention when the work was first published

One of the most important mathematical theories in modern engineering

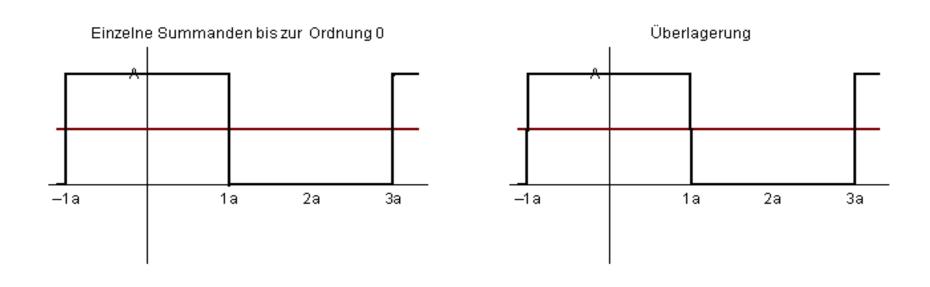

The Big Idea

Any function that periodically repeats itself can be expressed as a sum of sines and cosines of different frequencies each multiplied by a different coefficient – a *Fourier series*

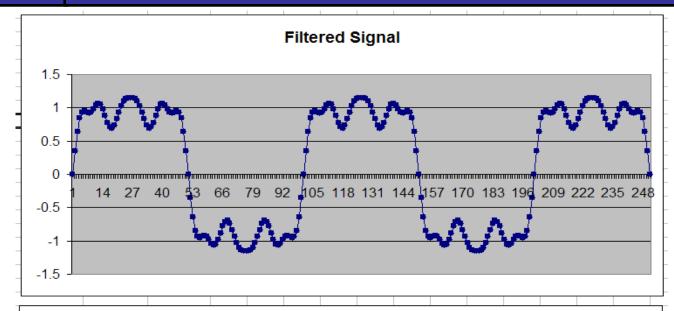

The Big Idea (cont...)

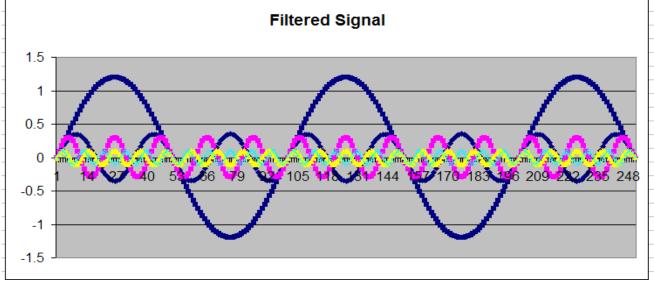

Notice how we get closer and closer to the original function as we add more and more frequencies

The Big Idea (cont...)

The Discrete Fourier Transform (DFT)

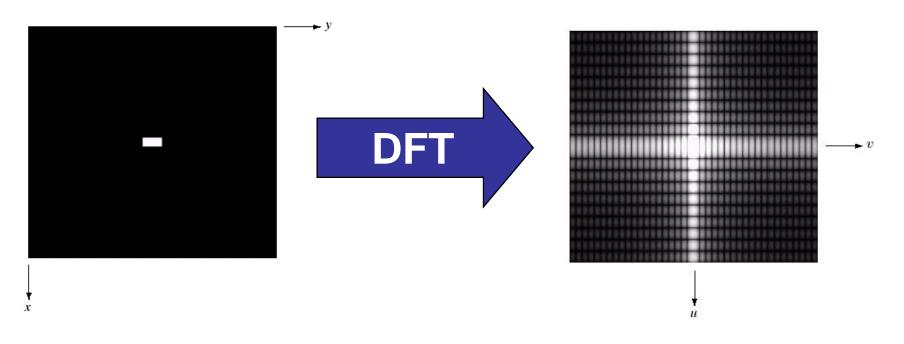

The *Discrete Fourier Transform* of f(x, y), for x = 0, 1, 2...M-1 and y = 0, 1, 2...N-1, denoted by F(u, v), is given by the equation:

$$F(u,v) = \sum_{x=0}^{M-1} \sum_{y=0}^{N-1} f(x,y) e^{-j2\pi(ux/M + vy/N)}$$

for u = 0, 1, 2...M-1 and v = 0, 1, 2...N-1.

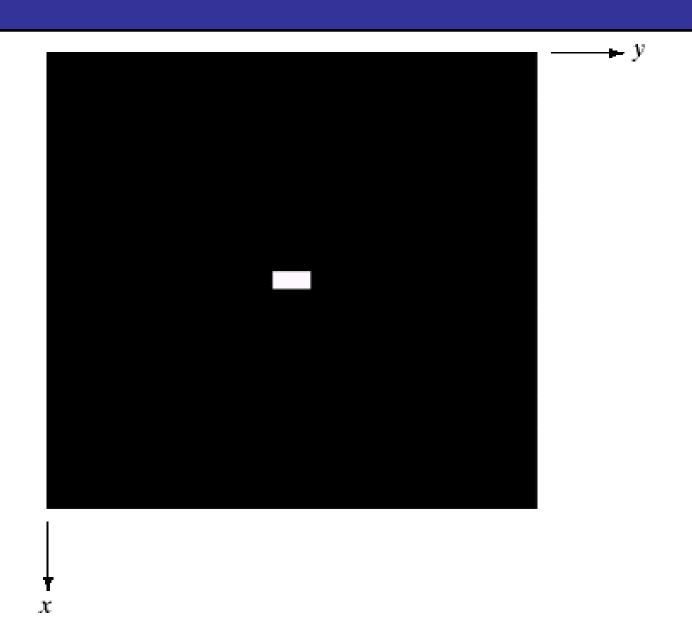

DFT & Images

The DFT of a two dimensional image can be visualised by showing the spectrum of the images component frequencies

DFT & Images (cont...)

DFT & Images (cont...)

The Inverse DFT

It is really important to note that the Fourier transform is completely **reversible**The inverse DFT is given by:

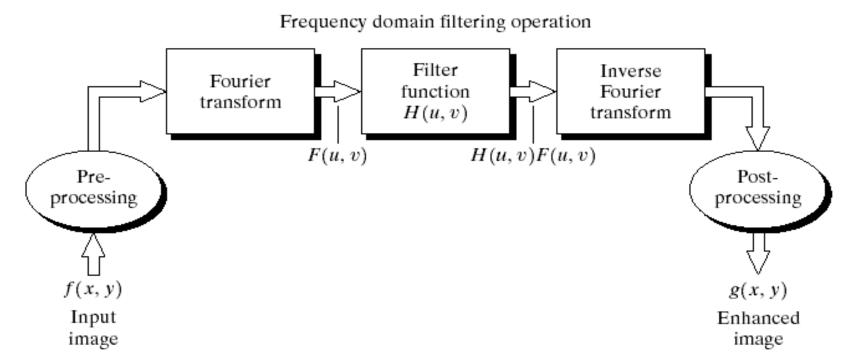

$$f(x,y) = \frac{1}{MN} \sum_{u=0}^{M-1} \sum_{v=0}^{N-1} F(u,v) e^{j2\pi(ux/M + vy/N)}$$

for x = 0, 1, 2...M-1 and y = 0, 1, 2...N-1

The DFT and Image Processing

To filter an image in the frequency domain:

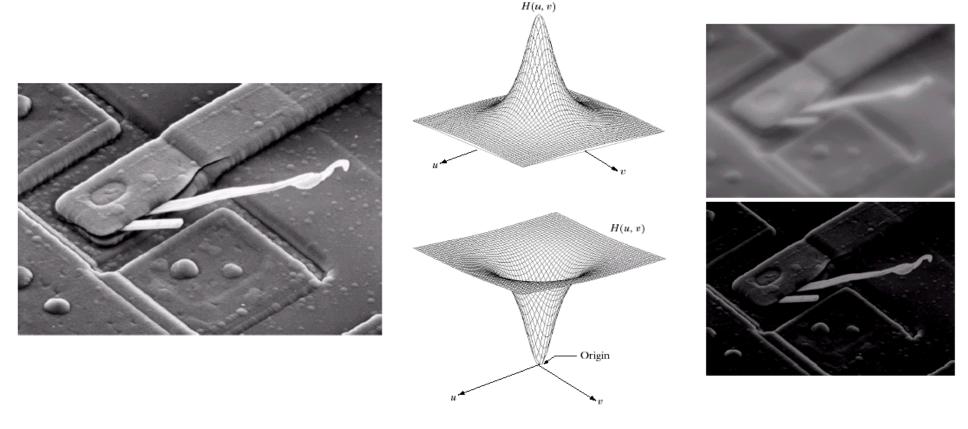

- 1. Compute F(u,v) the DFT of the image
- 2. Multiply F(u,v) by a filter function H(u,v)
- 3. Compute the inverse DFT of the result

Some Basic Frequency Domain Filters

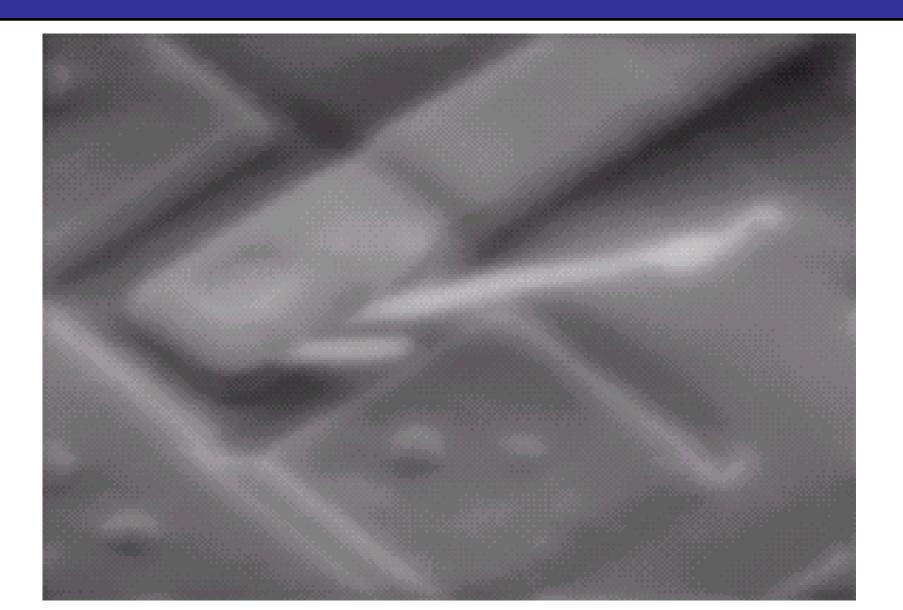

Low Pass Filter

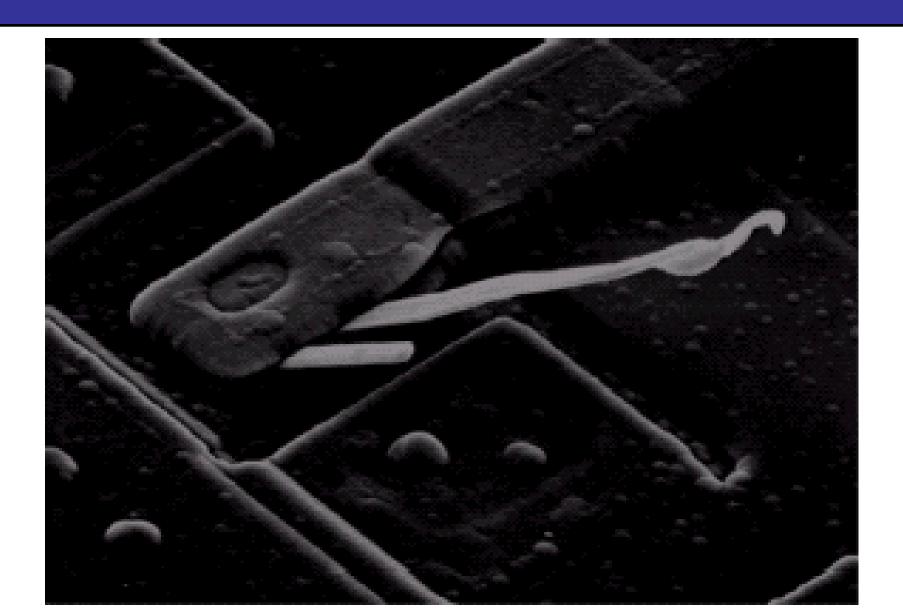

Some Basic Frequency Domain Filters

Some Basic Frequency Domain Filters

Smoothing Frequency Domain Filters

Smoothing is achieved in the frequency domain by dropping out the high frequency components. The basic model for filtering is:

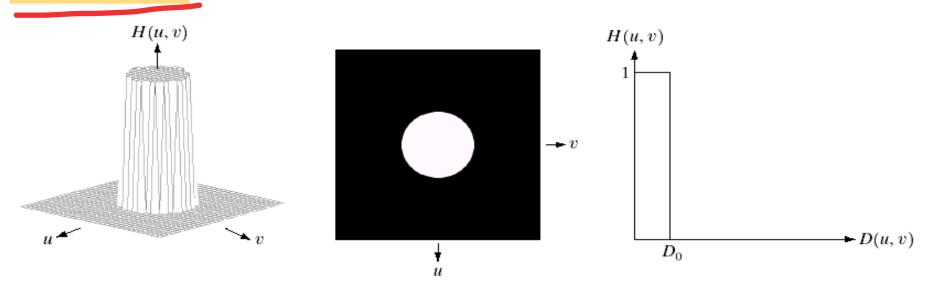

$$G(u,v) = H(u,v)F(u,v)$$

where F(u,v) is the Fourier transform of the image being filtered and H(u,v) is the filter transform function

Low pass filters — only pass the low frequencies, drop the high ones

Ideal Low Pass Filter

Simply cut off all high frequency components that are a specified distance D₀ from the origin of the transform

changing the distance changes the behaviour of the filter

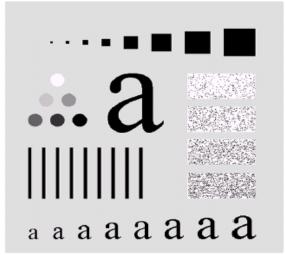

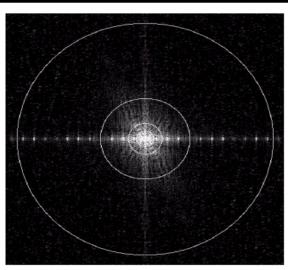

The transfer function for the ideal low pass filter can be given as:

$$H(u,v) = \begin{cases} 1 & \text{if } D(u,v) \le D_0 \\ 0 & \text{if } D(u,v) > D_0 \end{cases}$$

where D(u,v) is given as:

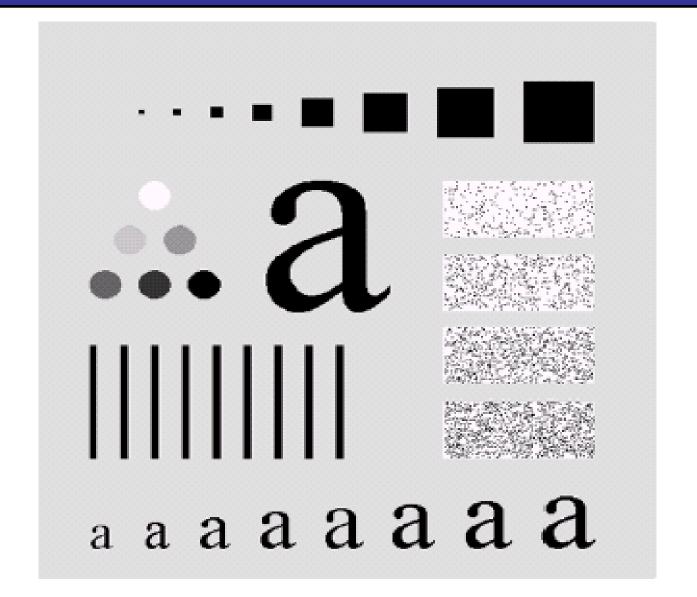

$$D(u,v) = [(u-M/2)^2 + (v-N/2)^2]^{1/2}$$
distance

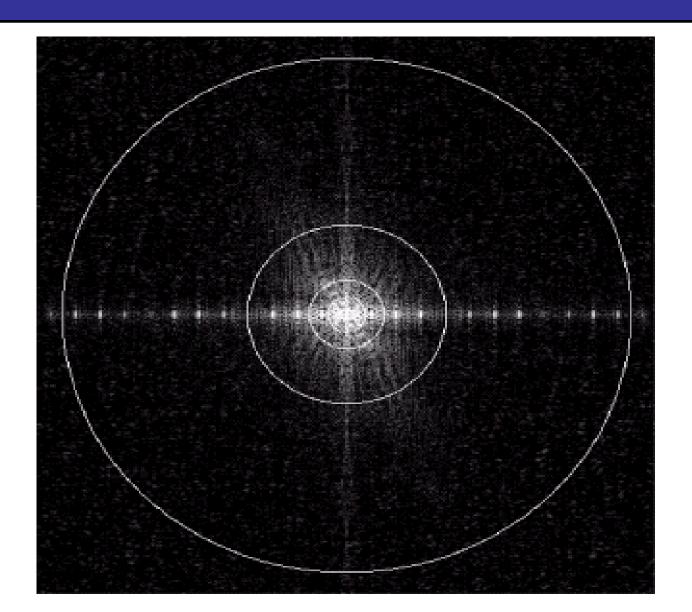

Above we show an image, it's Fourier spectrum and a series of ideal low pass filters of radius 5, 15, 30, 80 and 230 superimposed on top of it

Butterworth Lowpass Filters

The transfer function of a Butterworth lowpass filter of order n with cutoff frequency at distance D_0 from the origin is defined as:

$$H(u,v) = \frac{1}{1 + [D(u,v)/D_0]^{2n}}$$

Lowpass Filtering Examples

A low pass Gaussian filter is used to connect broken text

Historically, certain computer programs were written using only two digits rather than four to define the applicable year. Accordingly, the company's software may recognize a date using "00" as 1900 rather than the year 2000.

Sharpening in the Frequency Domain

Edges and fine detail in images are associated with high frequency components

High pass filters – only pass the high frequencies, drop the low ones

High pass frequencies are precisely the reverse of low pass filters, so:

$$H_{hp}(u, v) = 1 - H_{lp}(u, v)$$

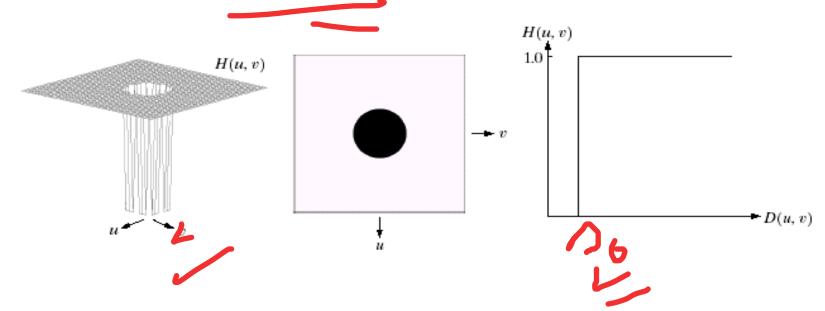

Ideal High Pass Filters

The ideal high pass filter is given as:

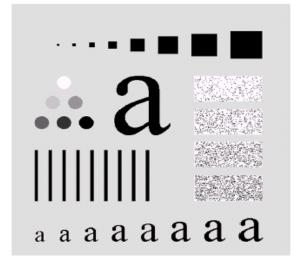

$$H(u,v) = \begin{cases} 0 & \text{if } D(u,v) \le D_0 \\ 1 & \text{if } D(u,v) > D_0 \end{cases}$$

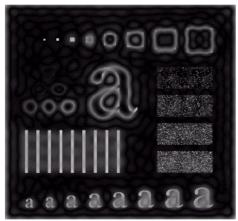

Ideal High Pass Filters (cont...)

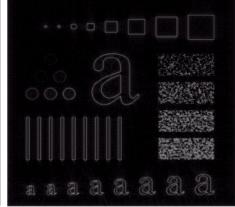

Results of ideal high pass filtering with $D_0 = 15$

Results of ideal high pass filtering with $D_0 = 30$

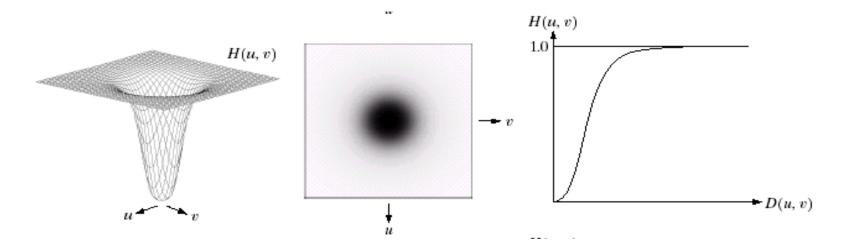

Results of ideal high pass filtering with $D_0 = 80$

Butterworth High Pass Filters

The Butterworth high pass filter is given as:

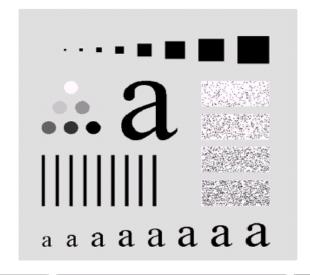

$$H(u,v) = \frac{1}{1 + [D_0/D(u,v)]^{2n}}$$

where n is the order and D_0 is the cut off distance as before

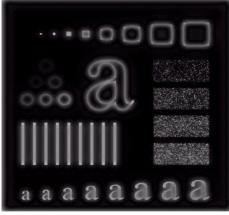

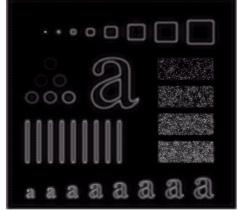

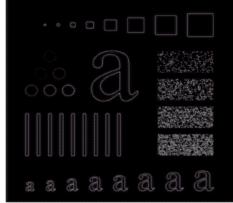

Butterworth High Pass Filters (cont...)

Frequency Domain Laplacian Example

Fast Fourier Transform

The reason that Fourier based techniques have become so popular is the development of the Fast Fourier Transform (FFT) algorithm

Allows the Fourier transform to be carried out in a reasonable amount of time

Reduces the amount of time required to perform a Fourier transform by a factor of 100 – 600 times!

Frequency Domain Filtering & Spatial Domain Filtering

Similar jobs can be done in the spatial and frequency domains

Filtering in the spatial domain can be easier to understand

Filtering in the frequency domain can be much faster – especially for large images

Summary

- In this lecture we examined image enhancement in the frequency domain
 - The Fourier series & the Fourier transform
 - Image Processing in the frequency domain
 - Image smoothing
 - Image sharpening
 - Fast Fourier Transform

Next time we will begin to examine image restoration using the spatial and frequency based techniques we have been looking at
